New laser technology improves spray tan accuracy

THE AUSTRALIAN GOLD LASER SPRAYTANS SYSTEM is revolutionizing the way we spray. With its patented laser-guided delivery system, it guarantees the lowest overspray, most accurate body detailing and drip-free application.

“This laser technology makes it unique in its market,” says Jennifer Homola, product brand manager for Australian Gold. The laser-guide applicators spray more accurately and use less product than traditional systems.

“The two red laser dots come closer together and become one to tell you you’ve precisely targeted the area you’re spraying at the proper distance for nice, even coverage,” says Homola, adding that its additional gravity-fed technology also makes it easy to clean, since the solution is in a cup above the gun instead of having to be squeezed through it.

The system also offers many alternative uses, since it can adopt different patterns: horizontal, vertical or diagonal. “It can be used to detail small areas, like tan lines, or just extremities; there’s a lot of flexibility.”

The high-volume, low-pressure feature, its quiet delivery and its low maintenance commitment make it very appealing to the spa industry as well. The Spraytans system has also attracted Hollywood makeup artists. Both Fox Network’s *The Swan* and model/actress Amanda Bynes endorse the product.—TC
